CLIMATOLOGICAL DATA

ILLINOIS

JANUARY 1951
Volume LVI No. 1

KANSAS CITY: 1951

ILLINOIS - JANUARY, 1951

Paul F. Sutton, Section Director - Springfield

WEATHER SUMMARY

Temperatures were above-normal on the majority of the days from the 1st to the 15th of January, but beginning with the 21st colder weather overspread the entire State and below-normal readings were recorded most of the remainder of the month. Highest temperatures during the month occurred at Sparta and Mount Carmel on the 18th, when readings of 70° were reached at those points. During the cold period at the end of the month, sub-zero temperatures were general, with the lowest being 29° below zero at Freeport on the morning of the 30th. Temperatures for the entire State averaged 28.4° during January, which was 0.7° above the normal. Highest monthly average was reported from Cairo, with 37.9°, and 15.7° at Stockton was the lowest monthly average. The temperature regime was one of contrasts, with the mild weather of the first 20 days followed by extensive sub-zero temperatures near the end of the month.

Precipitation during the month was near the normal, with a State-wide average of 2.34 inches. This average total is just 0.01 inch in excess of the normal. The greatest monthly total precipitation of all reporting stations was 8.30 inches at Brookport Dam 52, while the least monthly total was 0.66 inch at Carlinville 4 E. In the northern third of the State rather frequent precipitation periods occurred between the 20th and the 31st, with shorter periods between the 2d and the 6th and between the 12th and 15th. In the northern section of the State heaviest amounts fell on the 2d, when a number of stations reported 24-hour falls in excess of one inch. The short precipitation period in the middle of the month in the north consisted of very light amounts. In the central third of the State precipitation was distributed rather evenly over the month. There were no two consecutive days on which at least one station did not report precipitation, and as in the northern third, heaviest amounts fell on the 2d, with a number of stations reporting 24-hour amounts in excess of one inch. In the southern third the greater portion of the month's precipitation fell between the 1st and 16th, with amounts after that period being mostly traces except on the 28th, when moderate amounts fell over the entire area. Heaviest amounts in this section fell on the 14th, when 24-hour amounts in excess of 2 inches were recorded at some stations. Elizabethtown measured 3.69 inches on the 14th.

Snowfall during the month fell mostly in the cold period after the 21st. The maximum monthly snowfall was 19.7 inches at Sycamore, and the least amount was 1.0 inch at both Roberts and Alton Dam. A little unusual was the heavy snow which fell over southern sections on the 31st. On that day 5.5 inches was recorded at DuQuoin, 5.0 inches at Belleville, and 4.0 inches at a number of other points in the south.

Farm activities during the month were at the usual seasonal low point. Winter grains were not adversely affected by the weather and continued in good to excellent condition. Overhauling of farm machinery was about the only activity reported except some scattered marketing of livestock. Some concern about extensive winterkill of peach buds was reported from southern section, but no definite estimate as to the extent of the kill has been received.

No major storms were reported during the month. Glaze at Moline, Rock Island, and adjacent sections of the State resulted in an estimated $5,000 damage to property and a number of automobile accidents on the 2d and 3d. The heavy snow in southern sections on the 31st also caused some traffic accidents, but no monetary estimate from that source is available.--PFS

ACKNOWLEDGMENTS

In addition to the climatological data from some 6,000 Weather Bureau and cooperative weather stations, this bulletin series contains records from Hydroclimatic Network Stations which were formerly reproduced in the Hydrologic Bulletin Series. The Hydroclimatic Network is a nationwide net of rain gages --mostly of the recording type which produce continuous records of precipitation. It was established in 1939 at the request of the Corps of Engineers, Department of the Army, to supplement existing precipitation stations in order to provide records of rainfall intensity which were essential to the planning of flood control and related works by the Corps of Engineers. This Network, now numbering about 2,000 recording, and 1,000 non-recording rain gages, has been maintained by the Weather Bureau through working funds transferred annually to the Weather Bureau by the Corps of Engineers. These transfers averaged about $250,000 per year between 1940 and 1944, and nearly $375,000 since that date. For the years 1940-42, the Department of Agriculture transferred about $100,000 per year to provide data required in its work, and since 1947 the Bureau of Reclamation has transferred about $25,000 per year to meet the increasing needs of their program in the Western States.

Previous to the introduction of this bulletin series, data from Hydroclimatic Network stations were presented in bulletins (Hydrologic Bulletins) which were issued monthly for each of 8 drainage areas embracing the entire United States, but since the Network was established to meet the internal requirements of the Federal agencies referred to above, no provision was made for public dissemination of the data, distribution being limited to cooperating agencies and to certain public repositories. A list of locations where reference copies of the Hydrologic Bulletin Series are available for inspection may be obtained upon application to Chief, U. S. Weather Bureau, Washington 25, D. C.

Many other records published in this bulletin have been made available through the cooperation of various public offices, private agencies, and individuals as listed in the Station Index.

REFERENCE NOTES

The four digit identification numbers in the index number column of the Station Index are assigned on a state basis. There will be no duplication of numbers within a state.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Observation times given in the Station Index are in local standard time.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Monthly and seasonal snowfall for the preceding 12 months will be carried in the June issue of this bulletin.

Stations appearing in the Index, but for which data are not listed in the tables, are either missing or received too late to be included in this issue.

Unless otherwise indicated, dimensional units used in this bulletin are: temperature in °F, precipitation and evaporation in inches, and wind movement in miles. Evaporation is measured in the standard Weather Bureau type pan of 4 foot diameter unless otherwise shown by footnote following Table 6.

Sleet and hail were included in snowfall averages in Table 1, beginning with July 1948.

Amounts in Table 4 are from recording gages. Traces are not shown.

Amounts in Table 3 are from non-recording gages, unless otherwise indicated.

Data in Tables 3, 5, 6, and snowfall data in Table 7 are for the 24 hours ending at time of observation. See the Station Index for observation time.

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA stations. For these stations snow on ground values are at 1830 CST.

-	No record in Tables 3, 4, 6, 7, and the Station Index. No record in Tables 2 and 5 is indicated by no entry. When hourly precipitation is missing or accumulated for several days, only the first and last days are shown in Table 4.
+	And also on a later date or dates.
*	Amount included in following measurement, time distribution unknown.
//	Gage is equipped with a windshield.
6	Station not equipped with a recording gage. See Table 4 for 6-hourly measured amounts.
B	Adjusted to a full month.
E	Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of new snowfall.
M	One or more days of record missing; see Table 5 for detailed daily record. Degree Day data, if carried for this station, have been adjusted to represent the value for the full month.
R	Daily values and monthly total from recording gage. All other data in Table 3 are from non-recording gages.
T	Trace, an amount too small to measure.
V	Includes total for previous month.
SS	This entry in time of observation column in Station Index means observation made near sunset.

Subscription Price: 15 cents per copy; monthly and annual, $1.50 per year. (Yearly subscription includes the Annual Summary.) Checks, postal notes and money orders should be made payable to the Treasurer of the United States. Remittances and correspondence regarding subscriptions should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D. C.

ILLINOIS

FEBRUARY 1951
Volume LVI No. 2

KANSAS CITY: 1951

ILLINOIS - FEBRUARY, 1951

Paul F. Sutton, Section Director - Springfield

WEATHER SUMMARY

Precipitation during February was unusually heavy. The total monthly average of 4.03 inches for the State was the highest State average of record since 1909, and was the fourth highest in a continuous record extending back to 1890. Snowfall during the month averaged 5.0 inches, which is close to the normal. Precipitation was distributed rather well throughout the period. Very light daily amounts fell from the 1st to the 5th, but on the 6th general rain fell throughout the State, and a large number of stations in the southern two-thirds reported 24-hour amounts in excess of one inch. On this day amounts over the northern third averaged slightly under half an inch. Rather frequent rain or snow occurred in all sections from the 6th to the 21st, with heaviest amounts during this period occurring on the 16th and 20th, with some stations in the south reporting 24-hour amounts in excess of 2 inches on the latter date. Comparatively dry weather prevailed from the 22d to the 24th, but another period of frequent precipitation prevailed from the 25th to the 28th. Greatest monthly total precipitation was 8.13 inches at Hardin, and the least was 1.15 inches at Marseilles Lock. The greatest monthly snowfall was 9.8 inches at Bloomington Normal, and the least was a Trace at Carbondale Sewage Plant.

Temperatures during the month averaged 31.2°, 1.3° above the normal. The first half of the month brought temperatures mostly below normal, while the reverse was true of the latter half. Lowest temperature reported during the month was 25° below zero at both Aurora College and Olney Radio Station on the 2d, while the highest during the month was 73° on the 25th at Harrisburg. The southern location of the 25° below zero at Olney is worthy of note. Cairo averaged 40.5° for the highest monthly mean, while Stockton with 22.2°, had the lowest monthly mean.

Numerous localities reported glazed highways around the middle of the month, with resulting hazardous driving conditions, but apparently any damages due to this cause were on a minor scale. However, on the evening of February 20, strong winds damaged utility wires over a wide area in Saint Clair, Madison, and Jersey Counties. Particularly hard hit were the urban areas of East Saint Louis and Alton. Power service was disrupted for long periods in these areas. A wall of a new high school under construction at Bethalto was blown down, with an estimated $25,000 damage.

The heavy precipitation during the month caused a number of streams and rivers to reach bankfull or slightly higher stages, but no major overflows developed. The Illinois River reached bankfull or higher on the 17th from LaSalle southward, but no damage was reported, and these high stages continued through the end of the month.--PFS

ACKNOWLEDGMENTS

In addition to the climatological data from some 6,000 Weather Bureau and cooperative weather stations, this bulletin series contains records from Hydroclimatic Network Stations which were formerly reproduced in the Hydrologic Bulletin Series. The Hydroclimatic Network is a nationwide net of rain gages --mostly of the recording type which produce continuous records of precipitation. It was established in 1939 at the request of the Corps of Engineers, Department of the Army, to supplement existing precipitation stations in order to provide records of rainfall intensity which were essential to the planning of flood control and related works by the Corps of Engineers. This Network, now numbering about 2,000 recording, and 1,000 non-recording rain gages, has been maintained by the Weather Bureau through working funds transferred annually to the Weather Bureau by the Corps of Engineers. These transfers averaged about $250,000 per year between 1940 and 1944, and nearly $375,000 since that date. For the years 1940-42, the Department of Agriculture transferred about $100,000 per year to provide data required in its work, and since 1947 the Bureau of Reclamation has transferred about $25,000 per year to meet the increasing needs of their program in the Western States.

Previous to the introduction of this bulletin series, data from Hydroclimatic Network stations were presented in bulletins (Hydrologic Bulletins) which were issued monthly for each of 8 drainage areas embracing the entire United States, but since the Network was established to meet the internal requirements of the Federal agencies referred to above, no provision was made for public dissemination of the data, distribution being limited to cooperating agencies and to certain public repositories. A list of locations where reference copies of the Hydrologic Bulletin Series are available for inspection may be obtained upon application to Chief, U. S. Weather Bureau, Washington 25, D. C.

Many other records published in this bulletin have been made available through the cooperation of various public offices, private agencies, and individuals as listed in the Station Index.

Equipment moved from Henry to Lacon a distance of 6 miles SSW Lacon record will be a continuation of the Henry record

% Equipment moved 3 5 miles east of former location at Douglas Yates City record will be a continuation of Douglas record

REFERENCE NOTES

The four digit identification numbers in the index number column of the Station Index are assigned on a state basis. There will be no duplication of numbers within a state.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Observation times given in the Station Index are in local standard time.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Monthly and seasonal snowfall for the preceding 12 months will be carried in the June issue of this bulletin.

Stations appearing in the Index, but for which data are not listed in the tables, are either missing or received too late to be included in this issue.

Unless otherwise indicated, dimensional units used in this bulletin are: temperature in °F, precipitation and evaporation in inches, and wind movement in miles. Evaporation is measured in the standard Weather Bureau type pan of 4 foot diameter unless otherwise shown by footnote following Table 6.

Sleet and hail were included in snowfall averages in Table 1, beginning with July 1948.

Amounts in Table 4 are from recording gages. Traces are not shown.

Amounts in Table 3 are from non-recording gages, unless otherwise indicated.

Data in Tables 3, 5, 6, and snowfall data in Table 7 are for the 24 hours ending at time of observation. See the Station Index for observation time.

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA stations. For these stations snow on ground values are at 1830 CST.

-	No record in Tables 3, 4, 6, 7, and the Station Index. No record in Tables 2 and 5 is indicated by no entry. When hourly precipitation is missing or accumulated for several days, only the first and last days are shown in Table 4.
+	And also on a later date or dates.
*	Amount included in following measurement, time distribution unknown.
//	Gage is equipped with a windshield.
6	Station not equipped with a recording gage. See Table 4 for 6-hourly measured amounts.
B	Adjusted to a full month.
E	Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of new snowfall.
M	One or more days of record missing; see Table 5 for detailed daily record. Degree Day data, if carried for this station, have been adjusted to represent the value for the full month.
R	Daily values and monthly total from recording gage. All other data in Table 3 are from non-recording gages.
T	Trace, an amount too small to measure.
V	Includes total for previous month.
SS	This entry in time of observation column in Station Index means observation made near sunset.

Subscription Price: 15 cents per copy; monthly and annual, $1.50 per year. (Yearly subscription includes the Annual Summary.) Checks, postal notes and money orders should be made payable to the Treasurer of the United States. Remittances and correspondence regarding subscriptions should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D. C.

CLIMATOLOGICAL DATA

ILLINOIS

MARCH 1951
Volume LVI No. 3

KANSAS CITY: 1951

ILLINOIS - MARCH, 1951

Paul F. Sutton, Section Director - Springfield

WEATHER SUMMARY

Temperatures were above normal for the first week of March but were below normal thereafter, with the exception of one or two 48-hour periods during the latter part of the month. The highest temperature of the month was 80°, reported from Sparta on the 23d. Stockton reported the lowest reading, 4° on the 21st. The average temperature for the State was 37.8°, which is 3.2° below normal. The average temperature at Cairo of 47.2° constituted the highest average in the State, and the 29.5° average at Stockton the lowest.

Precipitation for the State during the month averaged 3.53 inches, which is 0.33 inch in excess of the normal. New Boston reported the greatest monthly total, 6.40 inches; and Rockford the least, 1.56 inches. Precipitation was general throughout the State during three periods: the 1st to the 3d, 10th to 21st, and 27th to 30th. The heaviest totals occurred on the 17th, when several stations reported falls in excess of 2.00 inches. In the southern section, comparatively heavy amounts were also reported on the 11th. There was no calendar day during the month on which precipitation was not reported from some point within the State.

Most of the month's snowfall occurred between the 10th and 21st, with the heaviest amounts being reported on the 13th. On that date, falls of 2.5 to 3.5 inches were common in the southern and central sections, while totals in the northern section of 4.0 to 7.0 inches were generally reported. The greatest monthly fall, 18.8 inches, was reported from LaHarpe, while the least total for the month, a Trace, occurred at Elizabethtown.

The month's excess of precipitation, coupled with below-normal temperature averages, was unfavorable for farm activities. However, frost left the ground over most of the State by the latter part of the month. Subsoil moisture, of course, was abundant. The oat acreage sown by the end of the month was about 1 per cent of the year's intended, as contrasted to approximately 25 per cent of the crop which is normally sown by the end of the month.

There were no major storms reported.--JTC

ACKNOWLEDGMENTS

In addition to the climatological data from some 6,000 Weather Bureau and cooperative weather stations, this bulletin series contains records from Hydroclimatic Network Stations which were formerly reproduced in the Hydrologic Bulletin Series. The Hydroclimatic Network is a nationwide net of rain gages --mostly of the recording type which produce continuous records of precipitation. It was established in 1939 at the request of the Corps of Engineers, Department of the Army, to supplement existing precipitation stations in order to provide records of rainfall intensity which were essential to the planning of flood control and related works by the Corps of Engineers. This Network, now numbering about 2,000 recording, and 1,000 non-recording rain gages, has been maintained by the Weather Bureau through working funds transferred annually to the Weather Bureau by the Corps of Engineers. These transfers averaged about $250,000 per year between 1940 and 1944, and nearly $375,000 since that date. For the years 1940-42, the Department of Agriculture transferred about $100,000 per year to provide data required in its work, and since 1947 the Bureau of Reclamation has transferred about $25,000 per year to meet the increasing needs of their program in the Western States.

Previous to the introduction of this bulletin series, data from Hydroclimatic Network stations were presented in bulletins (Hydrologic Bulletins) which were issued monthly for each of 8 drainage areas embracing the entire United States, but since the Network was established to meet the internal requirements of the Federal agencies referred to above, no provision was made for public dissemination of the data, distribution being limited to cooperating agencies and to certain public repositories. A list of locations where reference copies of the Hydrologic Bulletin Series are available for inspection may be obtained upon application to Chief, U. S. Weather Bureau, Washington 25, D. C.

Many other records published in this bulletin have been made available through the cooperation of various public offices, private agencies, and individuals as listed in the Station Index.

REFERENCE NOTES

The four digit identification numbers in the index number column of the Station Index are assigned on a state basis. There will be no duplication of numbers within a state.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Observation times given in the Station Index are in local standard time.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Monthly and seasonal snowfall for the preceding 12 months will be carried in the June issue of this bulletin.

Stations appearing in the Index, but for which data are not listed in the tables, are either missing or received too late to be included in this issue.

Unless otherwise indicated, dimensional units used in this bulletin are: temperature in °F, precipitation and evaporation in inches, and wind movement in miles. Evaporation is measured in the standard Weather Bureau type pan of 4 foot diameter unless otherwise shown by footnote following Table 6.

Sleet and hail were included in snowfall averages in Table 1, beginning with July 1948.

Amounts in Table 4 are from recording gages. Traces are not shown.

Amounts in Table 3 are from non-recording gages, unless otherwise indicated.

Data in Tables 3, 5, 6, and snowfall data in Table 7 are for the 24 hours ending at time of observation. See the Station Index for observation time.

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA stations. For these stations snow on ground values are at 1830 CST.

-	No record in Tables 3, 4, 6, 7, and the Station Index. No record in Tables 2 and 5 is indicated by no entry. When hourly precipitation is missing or accumulated for several days, only the first and last days are shown in Table 4.
+	And also on a later date or dates.
*	Amount included in following measurement, time distribution unknown.
//	Gage is equipped with a windshield.
6	Station not equipped with a recording gage. See Table 4 for 6-hourly measured amounts.
B	Adjusted to a full month.
E	Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of new snowfall.
M	One or more days of record missing; see Table 5 for detailed daily record. Degree Day data, if carried for this station, have been adjusted to represent the value for the full month.
R	Daily values and monthly total from recording gage. All other data in Table 3 are from non-recording gages.
T	Trace, an amount too small to measure.
V	Includes total for previous month.
SS	This entry in time of observation column in Station Index means observation made near sunset.

Subscription Price: 15 cents per copy; monthly and annual, $1.50 per year. (Yearly subscription includes the Annual Summary.) Checks, postal notes and money orders should be made payable to the Treasurer of the United States. Remittances and correspondence regarding subscriptions should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D. C.

CLIMATOLOGICAL DATA

ILLINOIS

APRIL 1951
Volume LVI No. 4

KANSAS CITY: 1951

ILLINOIS - APRIL, 1951

Paul F. Sutton, Section Director - Springfield

WEATHER BUREAU

The mean temperature for April 1951 of 49.6° was 2.9° below the normal, 52.5°. However, this average compared favorably with April of 1950, which was the coldest April since 1926. Mean monthly temperatures ranged from 55.9° at Cairo to 43.9° at Waukegan. At the beginning of the month, temperatures were averaging near normal in northern localities, slightly below normal in central sections, and considerably below normal in the southern third of the State. The second week found the State average well below normal. Below-normal readings continued in the southern third of the State for the following week, although the remainder of the State observed seasonable temperatures. The latter part of the month, however, brought readings considerably above normal over the entire State. It was during this period that Jerseyville reported a maximum temperature of 92° on the 28th, which was the highest reading reported during the month. The lowest temperature recorded was 22° at Walnut on the 5th, during the early subnormal period.

Precipitation totals were near normal over the State, the State-wide average being 3.45 inches as contrasted to a normal of 3.55 inches, or only 0.10 inch below normal. Light rain or snow was reported generally on April 1 and 2, and again during the period April 6-14. Rain was general again around the 20th and 22d, but the southern third of the State reported few significant falls after that date. However, extremely heavy totals were recorded in northern and central sections of the State on April 28 and 29. During those days, amounts in excess of 2 inches were reported from many central and northern observing points. Measurable precipitation was observed on 13 days of the month on the average. Mattoon recorded the greatest monthly total precipitation, 5.93 inches, while the least was reported from Barry--1.00 inch. Snowfall averaged 1.4 inches, with the greatest snowfall reported being 4.5 inches at Minonk. Eight observing stations reported that no snow fell during April. Rain and snow during the first half of the month impeded field work considerably, while grasses, legumes, and fall sown grains were retarded considerably by the below-normal temperatures of the first 3 weeks or so. The above-normal temperatures of the month's last week stepped up vegetative growth to a marked degree.

While no major storms were reported, thunderstorms in the Joliet-Lockport-Chicago area on April 28 caused considerable wind, flood, and lightning damage; and heavy rain during a thunderstorm at Springfield on the 29th resulted in flood damage.--JTC

ACKNOWLEDGMENTS

In addition to the climatological data from some 6,000 Weather Bureau and cooperative weather stations, this bulletin series contains records from Hydroclimatic Network Stations which were formerly reproduced in the Hydrologic Bulletin Series. The Hydroclimatic Network is a nationwide net of rain gages --mostly of the recording type which produce continuous records of precipitation. It was established in 1939 at the request of the Corps of Engineers, Department of the Army, to supplement existing precipitation stations in order to provide records of rainfall intensity which were essential to the planning of flood control and related works by the Corps of Engineers. This Network, now numbering about 2,000 recording, and 1,000 non-recording rain gages, has been maintained by the Weather Bureau through working funds transferred annually to the Weather Bureau by the Corps of Engineers. These transfers averaged about $250,000 per year between 1940 and 1944, and nearly $375,000 since that date. For the years 1940-42, the Department of Agriculture transferred about $100,000 per year to provide data required in its work, and since 1947 the Bureau of Reclamation has transferred about $25,000 per year to meet the increasing needs of their program in the Western States.

Previous to the introduction of this bulletin series, data from Hydroclimatic Network stations were presented in bulletins (Hydrologic Bulletins) which were issued monthly for each of 8 drainage areas embracing the entire United States, but since the Network was established to meet the internal requirements of the Federal agencies referred to above, no provision was made for public dissemination of the data, distribution being limited to cooperating agencies and to certain public repositories. A list of locations where reference copies of the Hydrologic Bulletin Series are available for inspection may be obtained upon application to Chief, U. S. Weather Bureau, Washington 25, D. C.

Many other records published in this bulletin have been made available through the cooperation of various public offices, private agencies, and individuals as listed in the Station Index.

REFERENCE NOTES

The four digit identification numbers in the index number column of the Station Index are assigned on a state basis. There will be no duplication of numbers within a state.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Observation times given in the Station Index are in local standard time.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Monthly and seasonal snowfall for the preceding 12 months will be carried in the June issue of this bulletin.

Stations appearing in the Index, but for which data are not listed in the tables, are either missing or received too late to be included in this issue.

Unless otherwise indicated, dimensional units used in this bulletin are: temperature in °F, precipitation and evaporation in inches, and wind movement in miles. Evaporation is measured in the standard Weather Bureau type pan of 4 foot diameter unless otherwise shown by footnote following Table 6.

Sleet and hail were included in snowfall averages in Table 1, beginning with July 1948.

Amounts in Table 4 are from recording gages. Traces are not shown.

Amounts in Table 3 are from non-recording gages, unless otherwise indicated.

Data in Tables 3, 5, 6, and snowfall data in Table 7 are for the 24 hours ending at time of observation. See the Station Index for observation time.

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA stations. For these stations snow on ground values are at 1830 CST.

-	No record in Tables 3, 4, 6, 7, and the Station Index. No record in Tables 2 and 5 is indicated by no entry. When hourly precipitation is missing or accumulated for several days, only the first and last days are shown in Table 4.
+	And also on a later date or dates.
*	Amount included in following measurement, time distribution unknown.
//	Gage is equipped with a windshield.
6	Station not equipped with a recording gage. See Table 4 for 6-hourly measured amounts.
B	Adjusted to a full month.
E	Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of new snowfall.
M	One or more days of record missing; see Table 5 for detailed daily record. Degree Day data, if carried for this station, have been adjusted to represent the value for the full month.
R	Daily values and monthly total from recording gage. All other data in Table 3 are from non-recording gages.
T	Trace, an amount too small to measure.
V	Includes total for previous month.
SS	This entry in time of observation column in Station Index means observation made near sunset.

Subscription Price: 15 cents per copy; monthly and annual, $1.50 per year. (Yearly subscription includes the Annual Summary.) Checks and money orders should be made payable to the Treasurer of the United States. Remittances and correspondence regarding subscriptions should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D. C.

WEATHER SUMMARY

Temperatures for May 1951 averaged 64.7°, in contrast to a normal of 62.7°. Mean temperatures for the month ranged from a high of 69.7° at Cairo to a low of 58.8° at Waukegan. The first week of the month found temperatures above normal in all sections. The following week, averages were near normal over the central and southern thirds of the State, and continued above-normal over the northern third. During the next week, temperatures in all sections averaged from 9° to 13° above normal. Temperatures then returned to normal in the northern third of the State and fell to below normal in central and southern localities, but they returned to above-normal the last few days of the month. Thus, the northern third of the State averaged 2.7° above normal for the month, the central third 2.0° above normal, and the southern third 1.2° above. The highest reading observed during the month was reported from Palestine on May 19, when a maximum temperature of 94° occurred. On May 7 and 10, Lacon reported a minimum temperature of 33°, which was the lowest reported by any observing point. While above-normal averages were reported from all sections of the State, May 1951 fell short of the average of 65.1° reported in 1949.

Precipitation totals on a State-wide basis were below normal, the average fall for the State being 3.26 inches, a deficiency of 0.87. However, the northern third of the State averaged 4.70 inches, which is 0.72 above normal. In central and southern localities, the trend was reversed, with an average fall of 2.78 inches being reported in the central third of the State and 2.27 in the southern third. These totals are 1.42 and 1.91 inches below normal, respectively. During the first week of the month, light showers were reported on nearly every day, but amounts were, for the most part, inconsequential. Around the 10th and 11th rains were general, with the northern third of the State receiving heavy falls. Following that, the next 10 days were comparatively dry except for scattered light shower activity in the north. Rain was general around the 22d and 23d, with locally heavy falls reported. Northern and central sections reported additional rain on the 27th and 28th, and widely scattered showers were reported daily for the remainder of the month. The heaviest total rainfall observed for the month was 7.88 inches, which was reported from New Boston Dam; while the least monthly total was only 1.00 inch, recorded at Carbondale.

No major storms were reported during the month, although wind and flood damage occurred generally in central sections on the 26th and 27th, with some damage to crops from spotty hailstorms reported.--JTC

ACKNOWLEDGMENTS

In addition to the climatological data from some 6,000 Weather Bureau and cooperative weather stations, this bulletin series contains records from Hydroclimatic Network Stations which were formerly reproduced in the Hydrologic Bulletin Series. The Hydroclimatic Network is a nationwide net of rain gages --mostly of the recording type which produce continuous records of precipitation. It was established in 1939 at the request of the Corps of Engineers, Department of the Army, to supplement existing precipitation stations in order to provide records of rainfall intensity which were essential to the planning of flood control and related works by the Corps of Engineers. This Network, now numbering about 2,000 recording, and 1,000 non-recording rain gages, has been maintained by the Weather Bureau through working funds transferred annually to the Weather Bureau by the Corps of Engineers. These transfers averaged about $250,000 per year between 1940 and 1944, and nearly $375,000 since that date. For the years 1940-42, the Department of Agriculture transferred about $100,000 per year to provide data required in its work, and since 1947 the Bureau of Reclamation has transferred about $25,000 per year to meet the increasing needs of their program in the Western States.

Previous to the introduction of this bulletin series, data from Hydroclimatic Network stations were presented in bulletins (Hydrologic Bulletins) which were issued monthly for each of 8 drainage areas embracing the entire United States, but since the Network was established to meet the internal requirements of the Federal agencies referred to above, no provision was made for public dissemination of the data, distribution being limited to cooperating agencies and to certain public repositories. A list of locations where reference copies of the Hydrologic Bulletin Series are available for inspection may be obtained upon application to Chief, U. S. Weather Bureau, Washington 25, D. C.

Many other records published in this bulletin have been made available through the cooperation of various public offices, private agencies, and individuals as listed in the Station Index.

REFERENCE NOTES

The four digit identification numbers in the index number column of the Station Index are assigned on a state basis. There will be no duplication of numbers within a state.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Observation times given in the Station Index are in local standard time.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Monthly and seasonal snowfall for the preceding 12 months will be carried in the June issue of this bulletin.

Stations appearing in the Index, but for which data are not listed in the tables, are either missing or received too late to be included in this issue.

Unless otherwise indicated, dimensional units used in this bulletin are: temperature in °F, precipitation and evaporation in inches, and wind movement in miles. Evaporation is measured in the standard Weather Bureau type pan of 4 foot diameter unless otherwise shown by footnote following Table 6.

Sleet and hail were included in snowfall averages in Table 1, beginning with July 1948.

Amounts in Table 4 are from recording gages. Traces are not shown.

Amounts in Table 3 are from non-recording gages, unless otherwise indicated.

Data in Tables 3, 5, 6, and snowfall data in Table 7 are for the 24 hours ending at time of observation. See the Station Index for observation time.

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA stations. For these stations snow on ground values are at 1830 CST.

-	No record in Tables 3, 4, 6, 7, and the Station Index. No record in Tables 2 and 5 is indicated by no entry. When hourly precipitation is missing or accumulated for several days, only the first and last days are shown in Table 4.
+	And also on a later date or dates.
*	Amount included in following measurement, time distribution unknown.
//	Gage is equipped with a windshield.
6	Station not equipped with a recording gage. See Table 4 for 6-hourly measured amounts.
B	Adjusted to a full month.
E	Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of new snowfall.
M	One or more days of record missing; see Table 5 for detailed daily record. Degree Day data, if carried for this station, have been adjusted to represent the value for the full month.
R	Daily values and monthly total from recording gage. All other data in Table 3 are from non-recording gages.
T	Trace, an amount too small to measure.
V	Includes total for previous month.
SS	This entry in time of observation column in Station Index means observation made near sunset.

Subscription Price: 15 cents per copy; monthly and annual, $1.50 per year. (Yearly subscription includes the Annual Summary.) Checks and money orders should be made payable to the Treasurer of the United States. Remittances and correspondence regarding subscriptions should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D. C.

ILLINOIS

JUNE 1951
Volume LVI No. 6

KANSAS CITY: 1951

ILLINOIS - JUNE 1951

Paul F. Sutton, Section Director - Springfield

WEATHER SUMMARY

Over the northern and central thirds of Illinois, June 1, 1951, found temperatures climbing to near-record peaks, with readings in the northern third of the State reaching the lower nineties and in central sections the middle and upper nineties. On June 1 Palestine recorded a maximum temperature of 99 degrees, which was the highest temperature observed for the month of June 1951 in Illinois. However, reversion to below-normal readings was quick, and June 5 found temperatures over the State ranging from the lower forties in the extreme north to near 50 degrees in the southern third of the State. On the 5th at Chicago Heights, the minimum temperature was 36 degrees, which was the lowest temperature reported for the month. There was no pronounced temperature trend for the remainder of the month, although periods of normal or above-normal temperatures were shorter or less-pronounced than were the subnormal periods. The Statewide average temperature was 69.7 degrees, which was 2.4 below normal.

State-wide precipitation averaged 6.17 inches, which was 2.15 in excess of normal for the month. With comparatively few exceptions, stations reported their heaviest falls during the last decade, particularly around the 27th and 28th. The greatest monthly total precipitation was recorded at Shawneetown, where 13.48 inches fell, while Lockport reported the lowest total--1.86 inches. The first decade of June found general, light showers on all days except the 2d. During the second decade this was also true except for the 11th. During June 20-26 this pattern continued and, until that time, it appeared that precipitation totals would be near normal. However, the last 4 days of the month extremely heavy falls occurred at stations in the central third of the State and at many points in the remainder of Illinois. The 24-hour fall for Lincoln on the 28th, for example, was 4.71 inches. Hail occurred at 17 stations during the month.

TORNADOES AND FLOODING OF JUNE 27-28

During June 27 and 28, widespread heavy rain and thunderstorm activity was reported from the Illinois River eastward through an area bordered by Fulton, Tazewell, McLean, and Vermilion Counties on the north to Greene, Macoupin, Montgomery, and Effingham Counties on the south. Flooding caused most of the damage reported, although hail and high winds played some part. Crop damage is estimated to have reached $2,364,000 and property damage $265,000 in that area. Simultaneously, two tornadoes were reported on the 27th--one in northern Logan County and the other in southern Logan County. Property damage from these storms reached a total of $905,000, with crop damage being estimated at $1,350,000. Three lives were lost during the period.--JTC

ACKNOWLEDGMENTS

In addition to the climatological data from some 6,000 Weather Bureau and cooperative weather stations, this bulletin series contains records from Hydroclimatic Network Stations which were formerly reproduced in the Hydrologic Bulletin Series. The Hydroclimatic Network is a nationwide net of rain gages --mostly of the recording type which produce continuous records of precipitation. It was established in 1939 at the request of the Corps of Engineers, Department of the Army, to supplement existing precipitation stations in order to provide records of rainfall intensity which were essential to the planning of flood control and related works by the Corps of Engineers. This Network, now numbering about 2,000 recording, and 1,000 non-recording rain gages, has been maintained by the Weather Bureau through working funds transferred annually to the Weather Bureau by the Corps of Engineers. These transfers averaged about $250,000 per year between 1940 and 1944, and nearly $375,000 since that date. For the years 1940-42, the Department of Agriculture transferred about $100,000 per year to provide data required in its work, and since 1947 the Bureau of Reclamation has transferred about $25,000 per year to meet the increasing needs of their program in the Western States.

Previous to the introduction of this bulletin series, data from Hydroclimatic Network stations were presented in bulletins (Hydrologic Bulletins) which were issued monthly for each of 8 drainage areas embracing the entire United States, but since the Network was established to meet the internal requirements of the Federal agencies referred to above, no provision was made for public dissemination of the data, distribution being limited to cooperating agencies and to certain public repositories. A list of locations where reference copies of the Hydrologic Bulletin Series are available for inspection may be obtained upon application to Chief, U. S. Weather Bureau, Washington 25, D. C.

Many other records published in this bulletin have been made available through the cooperation of various public offices, private agencies, and individuals as listed in the Station Index.

REFERENCE NOTES

The four digit identification numbers in the index number column of the Station Index are assigned on a state basis. There will be no duplication of numbers within a state.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Observation times given in the Station Index are in local standard time.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Monthly and seasonal snowfall and heating degree days for the preceding 12 months will be carried in the June issue of this bulletin.

Stations appearing in the Index, but for which data are not listed in the tables, are either missing or received too late to be included in this issue.

Unless otherwise indicated, dimensional units used in this bulletin are: temperature in °F., precipitation and evaporation in inches, and wind movement in miles. Degree days are based on a daily average of 65°F. Evaporation is measured in the standard Weather Bureau type pan of 4 foot diameter unless otherwise shown by footnote following Table 6.

Sleet and hail were included in snowfall averages in Table 1, beginning with July 1948.

Amounts in Table 4 are from recording gages. Traces are not shown.

Amounts in Table 3 are from non-recording gages, unless otherwise indicated.

Data in Tables 3, 5, 6, and snowfall data in Table 7 are for the 24 hours ending at time of observation. See the Station Index for observation time.

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA stations. For these stations snow on ground values are at 1830 CST.

-	No record in Tables 3, 4, 6, 7, and the Station Index. No record in Tables 2 and 5 is indicated by no entry. When hourly precipitation is missing or accumulated for several days, only the first and last days are shown in Table 4.
+	And also on a later date or dates.
*	Amount included in following measurement, time distribution unknown.
//	Gage is equipped with a windshield.
6	Station not equipped with a recording gage. See Table 4 for 6-hourly measured amounts.
B	Adjusted to a full month.
E	Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of new snowfall.
M	One or more days of record missing; see Table 5 for detailed daily record. Degree Day data, if carried for this station, have been adjusted to represent the value for the full month.
R	Daily values and monthly total from recording gage. All other data in Table 3 are from non-recording gages.
T	Trace, an amount too small to measure.
V	Includes total for previous month.
SS	This entry in time of observation column in Station Index means observation made near sunset.

Subscription Price: 15 cents per copy; monthly and annual, $1.50 per year. (Yearly subscription includes the Annual Summary.) Checks and money orders should be made payable to the Treasurer of the United States. Remittances and correspondence regarding subscriptions should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D. C.

CORRECTIONS

March 1950,	Table 2, Roberts 3 N, number of days with minium 32° or below should be 24.
	Table 2, Rockford, delete greatest day of precipitation and date, and delete number of days with .01 or more and number of days with .25 or more.
April 1950,	Table 3, Carpenter 1 SW, 1st should be .00, 2nd should be .78.
	Table 4, delete entries on 1st and 2nd. Correct entries on 2nd, should be .04 at noon, .05 at 1p, .03 at 2p, .12 at 4p, 12 at 5p, .14 at 6p, .26 at 7p, .02 at 8p, and .78 total.
May 1950,	Table 2, Wheaton College, delete all temperature entries.
December 1950,	Table 3, Wenona, 21st should be .06, 22nd 0, 25th .34, and total 1.07.
	Table 4, Wenona, 21st add .04 at 9p, .02 at 10p, and total of .06. On 25th, delete hourly amounts and add *'s from 6a to 11a inclusive, .34 at noon and change total to .34.
December 1950,	Table 2, Alton Dam, mean temperature 27.4, degree days 1159.
	Table 5, 3rd max 36, 6th max 26, mean max 36.8.
February 1951,	Table 3, Edelstein, delete entries on 26th and 28th and add dashes 22nd through 28th.
	Table 4, 22nd, enter dashes 11a through total, 26th, delete all entries, 28th, delete all entries and enter dashes 1a through total.
March 1951,	Table 3, Kewanee Baker Park, delete dashes and add daily amounts: 10th *, 11th *, 12th *, 13th *, 14th *, 15th 1.12, 17th *, 18th 6.8, 27th .04, 28th .59, 29th .78, 30th .15, total 3.60.
	Table 4, Kewanee Baker Park, precipitation entries on 28th, 29th, 30th and 31st should be moved back one day to the 27th, 28th, 29th and 30th.

ILLINOIS

JULY 1951
Volume LVI No. 7

KANSAS CITY: 1951

ILLINOIS - JULY 1951

Paul F. Sutton, Section Director - Springfield

WEATHER SUMMARY

July 1951 was a cool and, in most sections, abnormally wet month. Average temperature for the State was 74.8°, which was 1.6° below normal. However, this temperature deficiency was not nearly so marked as that of July 1950, when the average temperature was 72.9°. Average temperatures reported for the month ranged from 80.7° at Cairo to 69.4° at Marengo. The month's highest temperature, 98°, which was reported from both Alton Dam and East Saint Louis, is identical with last year's highest temperature, which was the lowest July maximum in 61 years of Statewide records. The State average total precipitation of 4.63 inches is 1.40 inches in excess of normal. Greatest monthly total observed was at Toulon, where 13.81 inches were recorded, while the least total for the month was reported from Salem, where only 1.30 inches fell.

Total monthly rainfall in excess of 9 inches fell in a belt extending from Iroquois County westward across southern Livingston County, Marshall, Stark and the southern portions of Henry and Bureau Counties. Local flooding in this area of high monthly totals resulted in appreciable local damage at a number of points. The area of least rainfall was a belt extending from Marion and Clay Counties northeastward across portions of Fayette, Effingham, Shelby, Christian and Macon Counties of Sangamon, where monthly totals of less than 2 inches were reported.

The first week of July was cool and, during this period, the lowest temperature for the State was reported when Chicago Heights observed a low reading of 44° on the 6th. The second week found temperatures somewhat higher in the southern third of the State but still below normal to the north. Following that, temperatures were above normal and, during this period, the month's high reading of 98° was reported, first from Alton Dam on the 16th and later from East Saint Louis on the 22nd. There was no pronounced temperature trend during the last decade of the month.

In the northern two-thirds of the State, heaviest rainfalls were centered around the 8th and 22nd. Chenoa reported a 24-hour fall of 8.20 inches on the 9th. Falls in the southern third of the State were sporadic with the greatest falls for any one day, 3.46 inches, occurring at Makanda on the 9th.

Despite a wet, cool month, most crops were normal. Corn averaged just under 6 feet in height, which was in advance of last year, and about 70% of the crop was tasseled. Wheat combining was completed by the end of the month and soybeans were 60% in bloom.

The heavy rains and locally severe thunderstorms of July 8 and 9 resulted in considerable crop and property damage in sections of Illinois north of a line from Danville to Lincoln to Peoria to Rock Island.--JTC

ACKNOWLEDGMENTS

In addition to the climatological data from some 6,000 Weather Bureau and cooperative weather stations, this bulletin series contains records from Hydroclimatic Network Stations which were formerly reproduced in the Hydrologic Bulletin Series. The Hydroclimatic Network is a nationwide net of rain gages --mostly of the recording type which produce continuous records of precipitation. It was established in 1939 at the request of the Corps of Engineers, Department of the Army, to supplement existing precipitation stations in order to provide records of rainfall intensity which were essential to the planning of flood control and related works by the Corps of Engineers. This Network, now numbering about 2,000 recording, and 1,000 non-recording rain gages, has been maintained by the Weather Bureau through working funds transferred annually to the Weather Bureau by the Corps of Engineers. These transfers averaged about $250,000 per year between 1940 and 1944, and nearly $375,000 since that date. For the years 1940-42, the Department of Agriculture transferred about $100,000 per year to provide data required in its work, and since 1947 the Bureau of Reclamation has transferred about $25,000 per year to meet the increasing needs of their program in the Western States.

Previous to the introduction of this bulletin series, data from Hydroclimatic Network stations were presented in bulletins (Hydrologic Bulletins) which were issued monthly for each of 8 drainage areas embracing the entire United States, but since the Network was established to meet the internal requirements of the Federal agencies referred to above, no provision was made for public dissemination of the data, distribution being limited to cooperating agencies and to certain public repositories. A list of locations where reference copies of the Hydrologic Bulletin Series are available for inspection may be obtained upon application to Chief, U. S. Weather Bureau, Washington 25, D. C.

Many other records published in this bulletin have been made available through the cooperation of various public offices, private agencies, and individuals as listed in the Station Index.

REFERENCE NOTES

The four digit identification numbers in the index number column of the Station Index are assigned on a state basis. There will be no duplication of numbers within a state.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Observation times given in the Station Index are in local standard time.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Monthly and seasonal snowfall and heating degree days for the preceding 12 months will be carried in the June issue of this bulletin.

Stations appearing in the Index, but for which data are not listed in the tables, are either missing or received too late to be included in this issue.

Unless otherwise indicated, dimensional units used in this bulletin are: temperature in °F., precipitation and evaporation in inches, and wind movement in miles. Degree days are based on a daily average of 65°F. Evaporation is measured in the standard Weather Bureau type pan of 4 foot diameter unless otherwise shown by footnote following Table 6.

Sleet and hail were included in snowfall averages in Table 1, beginning with July 1948.

Amounts in Table 4 are from recording gages. Traces are not shown.

Amounts in Table 3 are from non-recording gages, unless otherwise indicated.

Data in Tables 3, 5, 6, and snowfall data in Table 7 are for the 24 hours ending at time of observation. See the Station Index for observation time.

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA stations. For these stations snow on ground values are at 1830 CST.

-	No record in Tables 3, 4, 6, 7, and the Station Index. No record in Tables 2 and 5 is indicated by no entry. When hourly precipitation is missing or accumulated for several days, only the first and last days are shown in Table 4.
+	And also on a later date or dates.
*	Amount included in following measurement, time distribution unknown.
//	Gage is equipped with a windshield.
S	Station not equipped with a recording gage. See Table 4 for 6-hourly measured amounts.
B	Adjusted to a full month.
E	Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of new snowfall.
M	One or more days of record missing; see Table 5 for detailed daily record. Degree Day data, if carried for this station, have been adjusted to represent the value for the full month.
R	Daily values and monthly total from recording gage. All other data in Table 3 are from non-recording gages.
T	Trace, an amount too small to measure.
V	Includes total for previous month.
SS	This entry in time of observation column in Station Index means observation made near sunset.

Subscription Price: 15 cents per copy; monthly and annual, $1.50 per year. (Yearly subscription includes the Annual Summary.) Checks and money orders should be made payable to the Treasurer of the United States. Remittances and correspondence regarding subscriptions should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D. C.

ILLINOIS

AUGUST 1951
Volume LVI No. 8

KANSAS CITY: 1951

ILLINOIS - AUGUST 1951

Paul F. Sutton, Section Director - Springfield

WEATHER SUMMARY

August 1951 was cool, averaging 1.6° below normal, as did the preceding month of July. The average temperature for the month was 73.0°. The highest temperature of the month was reported from Harrisburg on the 31st, when a maximum reading of 103° was obtained. This contrasts to the lowest minimum temperature reported during the month, which was 42° observed at Marengo on the 4th and at Chicago Heights on the 24th. Marengo also reported the lowest mean temperature for the month, 66.9°. The highest mean temperature was registered at Cairo, where an average of 80.6° occurred.

Except for minor fluctuations, temperatures averaged near or slightly below normal during the first 3 weeks of August. However, the 4th, 5th, and 6th were cooler than the remainder of the 3-week period in the northern and central two-thirds of the State, with minimum temperatures on the 4th as low as 45° to 50° at many points in the area. The 22d-24th was another abnormally cool period during which minimum temperatures ranged from 45° to 50° over most of the State except slightly higher in the southern third. By the 26th, temperatures were generally above normal again, and the highest readings of the month occurred in most localities on the 30th or 31st.

Precipitation for the month averaged 4.27 inches in the northern third of the State, 3.70 inches in the central third, and 2.99 in the southern third. This represents rainfall of 0.93 inch above normal in the north, 0.43 inch above normal in the central, and 0.56 inch below normal in the southern division. The State-wide average of 3.71 inches is 0.35 inch above normal. Little or no precipitation of consequence was observed from the 1st to the 5th, but measurable rainfall occurred at some location in the State on each day of the following 7-day period, with heavy falls (mostly between 1.50 and 2.00 inches) being general over the northern third of the State on the 6th. Shower activity was also general during the 14-17th, the 22d-24th, and the last 5 days of the month. The heaviest total fall during August was 8.00 inches at Moline, and the least total was 1.15 inches at Albion.

Considerable damage to crops from flooding, resulting from thunderstorms around the 29th of the month, was reported from Rock Island, Henry, and Whiteside Counties, but otherwise no severe storms were reported.--JTC

ACKNOWLEDGMENTS

In addition to the climatological data from some 6,000 Weather Bureau and cooperative weather stations, this bulletin series contains records from Hydroclimatic Network Stations which were formerly reproduced in the Hydrologic Bulletin Series. The Hydroclimatic Network is a nationwide net of rain gages --mostly of the recording type which produce continuous records of precipitation. It was established in 1939 at the request of the Corps of Engineers, Department of the Army, to supplement existing precipitation stations in order to provide records of rainfall intensity which were essential to the planning of flood control and related works by the Corps of Engineers. This Network, now numbering about 2,000 recording, and 1,000 non-recording rain gages, has been maintained by the Weather Bureau through working funds transferred annually to the Weather Bureau by the Corps of Engineers. These transfers averaged about $250,000 per year between 1940 and 1944, and nearly $375,000 since that date. For the years 1940-42, the Department of Agriculture transferred about $100,000 per year to provide data required in its work, and since 1947 the Bureau of Reclamation has transferred about $25,000 per year to meet the increasing needs of their program in the Western States.

Previous to the introduction of this bulletin series, data from Hydroclimatic Network stations were presented in bulletins (Hydrologic Bulletins) which were issued monthly for each of 8 drainage areas embracing the entire United States, but since the Network was established to meet the internal requirements of the Federal agencies referred to above, no provision was made for public dissemination of the data, distribution being limited to cooperating agencies and to certain public repositories. A list of locations where reference copies of the Hydrologic Bulletin Series are available for inspection may be obtained upon application to Chief, U. S. Weather Bureau, Washington 25, D. C.

Many other records published in this bulletin have been made available through the cooperation of various public offices, private agencies, and individuals as listed in the Station Index.

SUPPLEMENTAL DATA

REFERENCE NOTES

The four digit identification numbers in the index number column of the Station Index are assigned on a state basis. There will be no duplication of numbers within a state.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Observation times given in the Station Index are in local standard time.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Monthly and seasonal snowfall and heating degree days for the preceding 12 months will be carried in the June issue of this bulletin.

Stations appearing in the Index, but for which data are not listed in the tables, are either missing or received too late to be included in this issue.

Unless otherwise indicated, dimensional units used in this bulletin are: temperature in °F., precipitation and evaporation in inches, and wind movement in miles. Degree days are based on a daily average of 65°F. Evaporation is measured in the standard Weather Bureau type pan of 4 foot diameter unless otherwise shown by footnote following Table 6.

Sleet and hail were included in snowfall averages in Table 1, beginning with July 1948.

Amounts in Table 4 are from recording gages. Traces are not shown.

Amounts in Table 3 are from non-recording gages, unless otherwise indicated.

Data in Tables 3, 5, 6, and snowfall data in Table 7 are for the 24 hours ending at time of observation. See the Station Index for observation time.

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA stations. For these stations snow on ground values are at 1830 CST.

-	No record in Tables 3, 4, 6, 7, and the Station Index. No record in Tables 2 and 5 is indicated by no entry. When hourly precipitation is missing or accumulated for several days, only the first and last days are shown in Table 4.
+	And also on a later date or dates.
*	Amount included in following measurement, time distribution unknown.
//	Gage is equipped with a windshield.
6	Station not equipped with a recording gage. See Table 4 for 6-hourly measured amounts.
B	Adjusted to a full month.
E	Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of new snowfall.
M	One or more days of record missing; see Table 5 for detailed daily record. Degree Day data, if carried for this station, have been adjusted to represent the value for the full month.
R	Daily values and monthly total from recording gage. All other data in Table 3 are from non-recording gages.
T	Trace, an amount too small to measure.
V	Includes total for previous month.
SS	This entry in time of observation column in Station Index means observation made near sunset.

Subscription Price: 15 cents per copy; monthly and annual, $1.50 per year. (Yearly subscription includes the Annual Summary.) Checks and money orders should be made payable to the Treasurer of the United States. Remittances and correspondence regarding subscriptions should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D. C.

ILLINOIS

SEPTEMBER 1951
Volume LVI No. 9

KANSAS CITY: 1951

ILLINOIS - SEPTEMBER 1951

Paul F. Sutton, Section Director - Springfield

WEATHER SUMMARY

September 1951 continued the below-normal temperature trend which began in June. The average temperature reported for Illinois was 64.0°, which was 3.7° below normal. The temperature range was considerable--since Elizabethtown and Jerseyville both reported high readings of 96° for the month, while a minimum temperature of 30° was observed at Marengo, Mount Carroll, Freeport, and Aurora. The high readings occurred on the afternoon of the 1st, with the lowest readings for the State falling on either the 28th or 29th. The highest mean temperature, 69.8°, was recorded at Cairo, and the lowest mean temperature of 59.7° was reported from both Marengo and Freeport. Temperatures over the entire State were far above normal on the 1st of September, but after that day readings were generally below normal for the remainder of the first decade. The period of the 10th through the 13th averaged above normal and was followed by subnormal readings until the 19th. No major trend was evidenced thereafter until the 28th and 29th, when temperatures were far below normal.

On a state-wide basis, precipitation averaged 3.49 inches, or 0.15 inch below normal for the month of September. Distribution was not uniform however. The northern third of the State averaged 3.56 inches, which was only 0.16 inch below normal. In the central third, the average fall was 2.72 inches (0.98 inch below normal), while the southern third of the State reversed the trend, reporting an average fall of 4.85 inches, which constituted an excess of 1.42 inches. Although northern sections generally reported falls below normal during the month, the Calumet Treatment Works in Chicago reported the greatest monthly total precipitation--8.26 inches. The least monthly total precipitation fell in Bloomington, where only 1.11 inches was measured. The first half of the month found scattered shower activity occurring somewhere within the State on nearly every day, with heaviest falls occurring on the 5th, 9th, and 12th. There was much less rainfall during the period between the 15th and 20th, but following that, each day found showers reported from some areas and comparatively heavy falls on the 21st; also, in northern sections on the 25th and 26th.

There were no major storms or extensive storm damage during the month, although local damage resulted from thunderstorm activity in northern and central localities on the 26th, when basement flooding and lightning strikes caused damage totaling approximately $15,000.--JTC

ACKNOWLEDGMENTS

In addition to the climatological data from some 6,000 Weather Bureau and cooperative weather stations, this bulletin series contains records from Hydroclimatic Network Stations which were formerly reproduced in the Hydrologic Bulletin Series. The Hydroclimatic Network is a nationwide net of rain gages --mostly of the recording type which produce continuous records of precipitation. It was established in 1939 at the request of the Corps of Engineers, Department of the Army to supplement existing precipitation stations in order to provide records of rainfall intensity which were essential to the planning of flood control and related works by the Corps of Engineers. This Network, now numbering about 2,000 recording, and 1,000 non-recording rain gages, has been maintained by the Weather Bureau through working funds transferred annually to the Weather Bureau by the Corps of Engineers. These transfers averaged about [illegible] per year between 1940 and 1944, and nearly $375,000 since that date. For the years 1940-42, the Department of Agriculture transferred about $100,000 per year to provide data required in its work, and since 1947 the Bureau of Reclamation has transferred about $25,000 per year to meet the increasing needs of their program in the Western States.

Previous to the introduction of this bulletin series, data from Hydroclimatic Network stations were presented in bulletins (Hydrologic Bulletins) which were issued monthly for each of 8 drainage areas embracing the entire United States, but since the Network was established to meet the internal requirements of the Federal agencies referred to above, no provision was made for public dissemination of the data, distribution being limited to cooperating agencies and to certain public repositories. A list of locations where reference copies of the Hydrologic Bulletin Series are available for inspection may be obtained upon application to Chief, U. S. Weather Bureau, Washington 25, D. C.

Many other records published in this bulletin have been made available through the cooperation of various public offices, private agencies, and individuals as listed in the Station Index.

REFERENCE NOTES

The four digit identification numbers in the index number column of the Station Index are assigned on a state basis. There will be no duplication of numbers within a state.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Observation times given in the Station Index are in local standard time.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Monthly and seasonal snowfall and heating degree days for the preceding 12 months will be carried in the June issue of this bulletin.

Stations appearing in the Index, but for which data are not listed in the tables, are either missing or received too late to be included in this issue.

Unless otherwise indicated, dimensional units used in this bulletin are: temperature in °F., precipitation and evaporation in inches, and wind movement in miles. Degree days are based on a daily average of 65°F. Evaporation is measured in the standard Weather Bureau type pan of 4 foot diameter unless otherwise shown by footnote following Table 6.

Sleet and hail were included in snowfall averages in Table 1, beginning with July 1948.

Amounts in Table 4 are from recording gages. Traces are not shown.

Amounts in Table 3 are from non-recording gages, unless otherwise indicated.

Data in Tables 3, 5, 6, and snowfall data in Table 7 are for the 24 hours ending at time of observation. See the Station Index for observation time.

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA stations. For these stations snow on ground values are at 1830 CST.

-	No record in Tables 3, 4, 6, 7, and the Station Index. No record in Tables 2 and 5 is indicated by no entry. When hourly precipitation is missing or accumulated for several days, only the first and last days are shown in Table 4.
+	And also on a later date or dates.
*	Amount included in following measurement, time distribution unknown.
//	Gage is equipped with a windshield.
6	Station not equipped with a recording gage. See Table 4 for 6-hourly measured amounts.
B	Adjusted to a full month.
E	Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of new snowfall.
M	One or more days of record missing; see Table 5 for detailed daily record. Degree Day data, if carried for this station, have been adjusted to represent the value for the full month.
R	Daily values and monthly total from recording gage. All other data in Table 3 are from non-recording gages.
T	Trace, an amount too small to measure.
V	Includes total for previous month.
SS	This entry in time of observation column in Station Index means observation made near sunset.

Subscription Price: 15 cents per copy; monthly and annual, $1.50 per year. (Yearly subscription includes the Annual Summary.) Checks and money orders should be made payable to the Treasurer of the United States. Remittances and correspondence regarding subscriptions should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D. C.

CLIMATOLOGICAL DATA

ILLINOIS

OCTOBER 1951
Volume LVI No. 10

NOTE: Beginning with the October 1951 issue of Climatological Data, Table 4, Hourly Precipitation, will be discontinued due to curtailment of the funds necessary for processing and publication of these data.

KANSAS CITY: 1951

ILLINOIS - OCTOBER 1951

Paul F. Sutton, Section Director - Springfield

WEATHER SUMMARY

The average temperature for October 1951 was 57.4°. The fact that the month's average temperatures for the State were 1.5° above normal was, in large part, due to the periods October 1-6 and 13-18 being much above normal. Thus, a considerable temperature excess was built up, even though the period from the 7th through the 11th was below normal. The last decade of the month lacked any pronounced temperature trend. During the first period of above-normal temperatures, a reading of 92° was reported at Harrisburg, East Saint Louis, Alton and Olney on October 4th, which was the date on which the highest temperature of the month occurred at the majority of Illinois stations. The lowest reading observed at any reporting station in Illinois during October was 24° at Marengo on the 11th. The range in mean temperatures was from 62.2° at Cairo to 51.5° at Marengo.

The range in total precipitation was great with a monthly total fall of 7.44 inches reported from Galena and only 0.97 inch from Mount Carmel. The State averaged 3.13 inches which is 0.46 inch in excess of normal. Stations in the southern two-thirds of the State reported precipitation totals which were, in nearly all cases, within 0.25 inch of normal. However, rainfall reported during October from observing points in the northern third of the State averaged 1.11 inches in excess of normal. Heaviest 24-hour amounts were measured on either the 7th or 23rd of the month by most stations.

At the end of October, roughly a third of the Illinois corn crop had been harvested and less than 5% of the soybean crop remained to be combined, although frequent rains during the last ten days of the month had caused general delay. Wheat seeding was nearing completion and precipitation was, therefore, not entirely disadvantageous. There had been no general hard freeze. However, reporting points in the northern third of the State obtained readings in the upper 20's during the last three days of the month and there were isolated instances of lower readings.

No major storms were reported. Heavy rains on the 23rd caused some local damage in southern localities.--JTC

REFERENCE NOTES

The four digit identification numbers in the index number column of the Station Index are assigned on a state basis. There will be no duplication of numbers within a state.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Observation times given in the Station Index are in local standard time.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Monthly and seasonal snowfall and heating degree days for the preceding 12 months will be carried in the June issue of this bulletin.

Stations appearing in the Index, but for which data are not listed in the tables, are either missing or received too late to be included in this issue.

Unless otherwise indicated, dimensional units used in this bulletin are: temperature in °F., precipitation and evaporation in inches, and wind movement in miles. Degree days are based on a daily average of 65°F. Evaporation is measured in the standard Weather Bureau type pan of 4 foot diameter unless otherwise shown by footnote following Table 6.

Sleet and hail were included in snowfall averages in Table 1, beginning with July 1948.

Amounts in Table 3 are from non-recording gages, unless otherwise indicated.

Data in Tables 3, 5, 6, and snowfall data in Table 7 are for the 24 hours ending at time of observation. See the Station Index for observation time.

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA stations. For these stations snow on ground values are at 1830 CST.

-	No record in Tables 3, 6, 7, and the Station Index. No record in Tables 2 and 5 is indicated by no entry.
+	And also on a later date or dates.
*	Amount included in following measurement, time distribution unknown.
//	Gage is equipped with a windshield.
B	Adjusted to a full month.
E	Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of new snowfall.
M	One or more days of record missing; see Table 5 for detailed daily record. Degree Day data, if carried for this station, have been adjusted to represent the value for the full month.
R	Daily values and monthly total from recording gage. All other data in Table 3 are from non-recording gages.
T	Trace, an amount too small to measure.
V	Includes total for previous month.
SS	This entry in time of observation column in Station Index means observation made near sunset.

Subscription Price: 15 cents per copy; monthly and annual, $1.50 per year. (Yearly subscription includes the Annual Summary.) Checks and money orders should be made payable to the Treasurer of the United States. Remittances and correspondence regarding subscriptions should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D. C.

CLIMATOLOGICAL DATA

ILLINOIS

NOVEMBER 1951
Volume LVI No. 11

KANSAS CITY: 1952

ILLINOIS - NOVEMBER 1951

Paul F. Sutton, Section Director - Springfield

WEATHER SUMMARY

November 1951 was the coldest November in Illinois since the origination of Statewide records in 1890. The average temperature for the State was 35.5°, while the previous lowest mean temperature was 36.4°, which occurred in both 1911 and 1892. During the first 10 days of the month, nearly all Illinois observing points recorded their lowest readings for the entire month, the lowest being -2° at Freeport on the 5th. The period immediately following the coldest days of the month was much warmer, and most of the highest readings for November were observed around the 13th. A maximum of 77° occurred at East Saint Louis on the 13th and was the highest of record for the State during November. During the remainder of the month there was no pronounced temperature trend, although the general average was subnormal. The highest monthly mean temperature was 42.1°, which was reported from Cairo, while the mean of 28.9° at Marengo was the lowest in the State.

Precipitation averaged 3.43 inches, which is only 0.81 inch in excess of normal. However, the average snowfall of 7.9 inches is the greatest of record for November in Illinois. Previously, the record fall was 6.4 inches, which had remained unchallenged since 1895. During the 6th and 7th, record or near-record snows were general, with depths accumulating to nearly 1 foot, particularly in central Illinois, where Decatur reported 11 inches on the ground on the 6th and Alton 10 inches on the 7th. However, most stations in northern and north-central Illinois received their greatest amounts of precipitation for a single day during the heavy rains of the 12th and 13th. In southern and south-central areas, the heaviest falls for a single day occurred either during the snow of the 6th and 7th or on the 23d. On the 23d rainfall was very heavy in the extreme southern portion of the State, and Cairo reported a total for the day of 3.02 inches.

Although there was an excess of soil moisture during the last 3 weeks of the month, corn harvest was normal or nearly so in most sections, with the greatest difficulty arising from the necessity for hand-picking. A limited amount of fall plowing was accomplished.

In addition to the damage brought about by the heavy snows of the 6th and 7th, strong northeasterly winds caused appreciable damage, especially along the shoreline of Lake Michigan, which was at an unusually high level. Tornadoes were reported at Campbell Hill and in Mason, Tazewell, and McLean Counties on the 13th, and caused damage estimated at $95,000 and $50,000, respectively. Heavy rains on the 13th and 14th caused much damage in the area around Waukegan.--JTC

DRAINAGE [illegible] MISSISSIPPI 5. OHIO 6. ROCK

REFERENCE NOTES

The four digit identification numbers in the index number column of the Station Index are assigned on a state basis. There will be no duplication of numbers within a state.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Observation times given in the Station Index are in local standard time.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Monthly and seasonal snowfall and heating degree days for the preceding 12 months will be carried in the June issue of this bulletin.

Stations appearing in the Index, but for which data are not listed in the tables, are either missing or received too late to be included in this issue.

Unless otherwise indicated, dimensional units used in this bulletin are: temperature in °F., precipitation and evaporation in inches, and wind movement in miles. Degree days are based on a daily average of 65°F. Evaporation is measured in the standard Weather Bureau type pan of 4 foot diameter unless otherwise shown by footnote following Table 6.

Sleet and hail were included in snowfall averages in Table 1, beginning with July 1948.

Amounts in Table 3 are from non-recording gages, unless otherwise indicated.

Data in Tables 3, 5, 6, and snowfall data in Table 7 are for the 24 hours ending at time of observation. See the Station Index for observation time.

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA stations. For these stations snow on ground values are at 1830 CST.

-	No record in Tables 3, 6, 7, and the Station Index. No record in Tables 2 and 5 is indicated by no entry.
+	And also on a later date or dates.
*	Amount included in following measurement, time distribution unknown.
//	Gage is equipped with a windshield.
B	Adjusted to a full month.
E	Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of new snowfall.
M	One or more days of record missing; see Table 5 for detailed daily record. Degree Day data, if carried for this station, have been adjusted to represent the value for the full month.
R	Daily values and monthly total from recording gage. All other data in Table 3 are from non-recording gages.
T	Trace, an amount too small to measure.
V	Includes total for previous month.
SS	This entry in time of observation column in Station Index means observation made near sunset.

Subscription Price: 15 cents per copy; monthly and annual, $1.50 per year. (Yearly subscription includes the Annual Summary.) Checks and money orders should be made payable to the Treasurer of the United States. Remittances and correspondence regarding subscriptions should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D. C.

ILLINOIS - DECEMBER 1951

Paul F. Sutton, Section Director - Springfield

WEATHER SUMMARY

In Illinois during December 1951 temperature averaged 1.5° below normal and precipitation averaged 0.36 inch above normal. Temperatures were highly variable during the month, with a State high of 77° being reached at Elizabethtown on the 31st and a low of 24° below zero at Aurora College on the 16th. The December high has been exceeded only once since 1890 by a 78° which occurred in 1948. The monthly low of 24° below zero is also close to the December record of 29° below zero, which occurred in both 1950 and 1914. The temperature distribution through the month consisted of very warm periods at the beginning and the end, with the middle portion being very cold. The State-wide monthly average of 29.7° was near the normal. The extreme averages for December are 40.8° in 1923 for the high and 22.0° in 1909 for the low.

Precipitation over the State during the month averaged 2.51 inches. The area of greatest precipitation was Wabash, White, Gallatin, Saline, Hardin, Pope, Massac, Johnson, Pulaski, and Alexander Counties, where monthly totals in excess of 6 inches were general. The area receiving the least amount was a belt including Tazewell, Mason, Menard, Morgan, Scott, and Pike Counties, where monthly totals were mostly between three-quarters inch and an inch and a quarter. The station receiving the greatest amount of precipitation during the month was Cairo with 7.99 inches, and the least amount was 0.62 at Havana. The first 3 days of the month were comparatively dry, but beginning with the 4th frequent rains or snows occurred until the 25th, after which dry weather extended to the close of the month. Heaviest rains, particularly in the southern third, fell on the 8th, 14th, and 20th, when a number of stations measured more than an inch in 24 hours.

Snowfall during the period was quite heavy; in fact the December 1951 average fall of 11.6 inches has been exceeded only once since 1890. This was in 1909 when 14.9 inches fell during December. Wheaton College, with a monthly total snowfall of 40.5 inches, was the greatest of reporting stations, while Elizabethtown with only a Trace reported the least. Most of the month's snow fell during the middle half of the month, with daily totals of 4 to 7 inches being general in the northern half of the State on the 14th, 18th, 20th, and 25th.

Wet fields during the warm periods and snow cover during the cold periods, prevented farmers from accomplishing much field work during the month, but reports on the condition of winter grains continued to be favorable.

Heavy snows, particularly in the northern quarter of the State, resulted in numerous periods of blocked highways. In some cases persons were stranded by drifts, but no major damage or loss of life resulted.

REFERENCE NOTES

The four digit identification numbers in the index number column of the Station Index are assigned on a state basis. There will be no duplication of numbers within a state.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Observation times given in the Station Index are in local standard time.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Monthly and seasonal snowfall and heating degree days for the preceding 12 months will be carried in the June issue of this bulletin.

Stations appearing in the Index, but for which data are not listed in the tables, are either missing or received too late to be included in this issue.

Unless otherwise indicated, dimensional units used in this bulletin are: temperature in °F., precipitation and evaporation in inches, and wind movement in miles. Degree days are based on a daily average of 65°F. Evaporation is measured in the standard Weather Bureau type pan of 4 foot diameter unless otherwise shown by footnote following Table 6.

Sleet and hail were included in snowfall averages in Table 1, beginning with July 1948.

Amounts in Table 3 are from non-recording gages, unless otherwise indicated.

Data in Tables 3, 5, 6, and snowfall data in Table 7 are for the 24 hours ending at time of observation. See the Station Index for observation time.

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA stations. For these stations snow on ground values are at 1830 CST.

-	No record in Tables 3, 6, 7, and the Station Index. No record in Tables 2 and 5 is indicated by no entry.
+	And also on a later date or dates.
*	Amount included in following measurement, time distribution unknown.
//	Gage is equipped with a windshield.
B	Adjusted to a full month.
E	Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of new snowfall.
M	One or more days of record missing; see Table 5 for detailed daily record. Degree Day data, if carried for this station, have been adjusted to represent the value for the full month.
R	Daily values and monthly total from recording gage. All other data in Table 3 are from non-recording gages.
T	Trace, an amount too small to measure.
V	Includes total for previous month.
SS	This entry in time of observation column in Station Index means observation made near sunset.

Subscription Price: 15 cents per copy; monthly and annual, $1.50 per year. (Yearly subscription includes the Annual Summary.) Checks and money orders should be made payable to the Treasurer of the United States. Remittances and correspondence regarding subscriptions should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D. C.

[illegible]

See reference notes following Station Index.

ANNUAL SUMMARY 1951

Volume LVI No. 13

KANSAS CITY: 1952

ILLINOIS - 1951

Paul F. Sutton, Section Director - Springfield

WEATHER SUMMARY

The year 1951 was both cold and wet in Illinois. On a State-wide basis only 3 months averaged above normal in temperature, and the entire summer was below normal. Temperatures also failed to reach normal levels during March and April, which retarded the growing season considerably, although this was not reflected in crop yield. November 1951 was the coldest November ever recorded in Illinois. The annual extremes ranged from a reading of 103° at Harrisburg on August 31 to a -24° at Aurora on December 2. Precipitation was extremely heavy during February, June, and July, while November's snowfall was the heaviest of record for that month. Precipitation was below normal only during the months of April, May, and September. Only in May was the average precipitation more than 0.15 inch below normal.

WEATHER BY MONTHS - 1951

JANUARY - Below-normal temperatures in the extreme northern portion of the State were counterbalanced by above-normal readings over the remainder of the State, so that temperatures averaged slightly above normal. Conversely, excessive rainfall in the southern third of the State was sufficiently in excess of normal to result in a State-wide total which was normal or a little above, even though central and northern portions reported subnormal totals. Heavy snows occurred in the southern counties on the 31st, and total falls in excess of 5 inches were reported.

FEBRUARY - Both temperature and precipitation continued to average above normal. Precipitation totals averaged heavier than in any February since 1909, although snowfall was near normal. Minor overflows were reported from a number of streams and rivers due to the heavy rainfall, but no major damage occurred. The first half of the month was cold, while the following two weeks reversed the trend, so that the month's average was above normal. However, on the 2nd temperatures as far south as Olney dropped to -25°.

MARCH - This month was cold and wet. Although the first week was warm, the remainder of the period was, for the most part, considerably below normal. Rainfall was excessive, particularly around the 11th and 17th. The excess precipitation, together with the temperature deficiency, hampered farming activities. There was little frost left in the ground over most of the State at the end of the month.

APRIL - The subnormal temperature trend established during March continued throughout most of April; during the last week of the month temperatures were at seasonable levels. Although precipitation totals were about normal, heavy amounts were recorded in northern and central counties on the 29th and 30th. Lighter totals had occurred earlier in the month at frequent intervals, and field work was considerably impeded. The subnormal temperatures retarded growth of vegetation markedly until the last few days of the month, when rapid improvement was noted.

MAY - There was no prolonged period of below-normal temperatures during this month, nor did freezing temperatures occur at any station. Precipitation totals varied considerably, with amounts less than normal reported from most southern and central sections. Rainfall was comparatively frequent throughout the first half of the month; then a dry period ensued until heavy amounts were reported from northern and central areas on the 27th and 28th. Spotty flood and wind damage to crops occurred during this latter period. Local hail damage was also reported.

JUNE - Temperatures on June 1 climbed to near-record high levels over northern and central Illinois. However, the retrogression to below-normal levels was rapid, and after the 5th there were no prolonged periods of abnormally warm weather. Precipitation was seasonal for the first 3 weeks or so of the month, but the last 4 days were marked by heavy rains, particularly over central Illinois, where 24-hour falls of more than 4 inches occurred. This widespread heavy rain with thunderstorm activity, resulted in serious flooding in central counties. Crop damage was estimated at $2,364,000 with additional property loss totaling $265,000. On the 27th two tornadoes were reported in Logan County, which caused crop loss estimated at $1,350,000 and property damage of $905,000. Three lives were lost during the period.

JULY - The cool and wet regime continued during July. There were no readings as high as 100° anywhere in the State, and during the first week of the month a minimum of 44° occurred at Chicago Heights. Rainfall was generally above normal. In a belt extending from Iroquois County westward through Marshall, Stark, and southern Livingston, totals reached more than nine inches during the month. Over the northern two-thirds of the State, heavy rains centered around the 8th and 22d caused extensive flooding. Despite the below-normal temperature trend and the excessive rainfall, crop conditions were regarded as normal.

AUGUST - During this month temperatures continued below normal, with little or no trend being evident during the first 3 weeks. The last few days were warm, and most of the highest readings for the month occurred during that period. Precipitation was above normal in northern and central sections, but below in the extreme south. Flooding in connection with thunderstorms around the end of the month caused considerable damage to crops, particularly in northwestern sections.

SEPTEMBER - Again, temperatures averaged below normal. The range between extremes was considerable, from 96° to 30°. The 1st was hot, but following temperatures were mostly below normal except for a brief period around the 10th. Although rainfall was greater than normal in the extreme south, the State as a whole averaged below normal. Least amounts were recorded in central portions. Some of the monthly falls were scarcely more than an inch.

OCTOBER - For the first time since May, temperatures averaged above normal, largely due to warm periods comprising the first and third weeks. Temperature extremes ranged from 92° to 24°. Precipitation was somewhat in excess of normal, with greatest totals being reported from the northern third of the State. Corn was about one-third harvested, and wheat seeding was nearing completion. There was no general hard freeze, although readings in the 20's occurred at some northern points during the last 3 days of the month.

NOVEMBER - The mean temperature for the State of 35.5° was the lowest average ever recorded for any November. During the first 10 days of the month temperatures fell to record and near record levels. However, a reaction to warmer followed for a brief period around the 13th, but the latter half of the month was mostly subnormal again. While the precipitation total was not greatly in excess of normal, the snowfall total was an all-time record high for November. On the 6th and 7th, heavy snow was general with depths accumulating to near 1 foot, particularly in central Illinois. In spite of heavy precipitation totals, corn harvest was normal. Tornadoes were reported at Campbell Hill and in Mason, Tazewell, and McLean Counties on the 13th, resulting in damage estimated at $95,000 and $50,000, respectively. Strong northeasterly winds on the 6th and 7th resulted in appreciable damage along the shore line of Lake Michigan.

DECEMBER - Temperatures ranged from a high reading of 77° to a low of -24°. The first and last portions of the month were mild, with the middle period being very cold. As a result, the State-wide average was near normal. In the extreme southeastern portion of the State precipitation was heavy, with monthly totals in excess of 6 inches being common. On the other hand, central localities recorded very light totals, many of which were less than an inch. There was no major storm activity, although heavy snows blocked highways and caused minor damage.
--JTC

CHANGES IN STATION NAME

Jamestown: Listed as [illegible] prior to February [illegible]. Rain gage moved [illegible] miles west.

RELOCATIONS OR CHANGES IN EXPOSURE OF INSTRUMENTS

Aledo: Equipment moved 0.3 miles east on November 6.

[illegible]

Barry: Rain gage moved 0.3 miles south on March 2.

[illegible] Rain gage moved [illegible]

Bradford CAA AP: Equipment moved 40 feet north on September 21.

Effingham 1 SW: Equipment moved 0.9 miles southwest on November 27.

Hoopeston: Equipment moved 1 mile northeast on May 1.

Kewanee: Equipment moved [illegible]

Lacon: Equipment moved 0.3 mile east on May 5 and 0.3 mile west on November 7.

Marshall: Rain gage moved 0.5 mile southeast on February 22.

Monmouth: Equipment moved 1.1 mile southeast on August 30.

Monticello: Rain gage moved 0.7 mile northeast on November 9.

REFERENCE NOTES

Unless otherwise indicated, dimensional units used in this bulletin are: Temperature in °F; precipitation and evaporation in inches, and wind movement in miles. Evaporation is measured in the standard Weather Bureau type pan of 4 foot diameter unless otherwise shown by footnote following Table 4.

The four digit identification numbers in the Index are assigned on a state basis. There will be no duplication of numbers within a state.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Delayed data and corrections will be carried in the June and December issues of Climatological Data.

No record.

+ Also later date (dates) or months.

* [illegible]

[illegible]

B Adjusted to full month.

E Water equivalent of snowfall wholly or partially estimated, using a ratio of 1 inch of water equivalent to every 10 inches of new snowfall.

M 1 to 9 days' record missing; see monthly Climatological Data for detailed daily record.

R Station equipped with a recording gage only.

T Trace, an amount too small to measure.

V Includes total for previous month.

Subscription Price: 15 cents per copy, monthly and annual; $1.50 per year. (Yearly subscription includes the Annual Summary.) Checks and money orders should be made payable to the Treasurer of the United States. Remittances and correspondence regarding subscriptions should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D. C.

CLIMATOLOGICAL DATA

ILLINOIS

JANUARY 1952
Volume LVII No. 1

KANSAS CITY: 1952

ILLINOIS - JANUARY 1952

Paul F. Sutton, Section Director - Springfield

WEATHER SUMMARY

During January 1952 both temperature and precipitation trends as established during the preceding December were reversed. A deficiency in precipitation was general, while the average temperature for Illinois was 31.6°, or 3.9° above normal. As was true in the preceding month, the temperature range over the State was wide. Greenville reported a maximum reading of 77° on the 17th, and a week later, on the 24th, Stockton experienced the lowest reading, 15° below zero. Although there were minor fluctuations during the early part of the month, no pronounced temperature trend was evident until the period between January 14 and 20. During that time, the high readings of the month were reported by most stations in the State. After a return to near-normal readings, the second marked trend occurred from the 24th through the 29th, and it was during this period that the State's lowest readings were observed. In addition to the Stockton minimum of 15° below zero on the 24th, 12° below zero was reported from Freeport, Marengo, and Mount Carroll.

The first 5 days of the month were marked by light precipitation. There was no more precipitation of consequence until the 19th when general rains occurred. Although light precipitation was reported almost daily during the last decade of January, falls were light for the most part. The State-wide average for the month was only 1.76 inches, which is 0.57 inch below normal. The greatest monthly total precipitation was reported by the Weather Bureau Office at Cairo where 5.36 inches fell during January. The least total was at Quincy, where the C.A.A. station measured only 0.47 inch during the month. Snowfall ranged from a total of 12.0 inches at Stockton to less than 1 inch at several stations.

A glaze storm on January 1 and 2 in Alexander, Pulaski, and Union Counties resulted in a property loss estimated at $176,250. Freezing rain and/or drizzle occurred almost continuously from the evening of the 1st through the 2d, causing extensive damage to utility installations.--JTC

REFERENCE NOTES

The four digit identification numbers in the index number column of the Station Index are assigned on a state basis. There will be no duplication of numbers within a state.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Observation times given in the Station Index are in local standard time.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Monthly and seasonal snowfall and heating degree days for the preceding 12 months will be carried in the June issue of this bulletin.

Stations appearing in the Index, but for which data are not listed in the tables, are either missing or received too late to be included in this issue.

Unless otherwise indicated, dimensional units used in this bulletin are: temperature in °F., precipitation and evaporation in inches, and wind movement in miles. Degree days are based on a daily average of 65°F. Evaporation is measured in the standard Weather Bureau type pan of 4 foot diameter unless otherwise shown by footnote following Table 6.

Sleet and hail were included in snowfall averages in Table 1, beginning with July 1948.

Amounts in Table 3 are from non-recording gages, unless otherwise indicated.

Data in Tables 3, 5, 6, and snowfall data in Table 7 are for the 24 hours ending at time of observation. See the Station Index for observation time.

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA stations. For these stations snow on ground values are at 1830 CST.

-	No record in Tables 3, 6, 7, and the Station Index. No record in Tables 2 and 5 is indicated by no entry.
+	And also on a later date or dates.
*	Amount included in following measurement, time distribution unknown.
//	Gage is equipped with a windshield.
B	Adjusted to a full month.
E	Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of new snowfall.
M	One or more days of record missing; see Table 5 for detailed daily record. Degree Day data, if carried for this station, have been adjusted to represent the value for the full month.
R	Daily values and monthly total from recording gage. All other data in Table 3 are from non-recording gages.
T	Trace, an amount too small to measure.
V	Includes total for previous month.
SS	This entry in time of observation column in Station Index means observation made near sunset.

Subscription Price: 15 cents per copy; monthly and annual, $1.50 per year. (Yearly subscription includes the Annual Summary.) Checks and money orders should be made payable to the Treasurer of the United States. Remittances and correspondence regarding subscriptions should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D. C.

KANSAS CITY: 1952

ILLINOIS - FEBRUARY 1952

Paul F. Sutton, Section Director - Springfield

WEATHER SUMMARY

This month was the warmest February in Illinois since 1938. As early as the 10th, maximum temperatures ranged from the middle 50's in northern localities to 75° at East Saint Louis. This latter reading was the highest recorded in the State during the entire month. Another feature of the month's unusual temperature regime was the failure of any reporting station to reach a minimum of zero; in fact, 8° which occurred at Aurora College on the 22d, was the lowest observed during the month. The lowest reading in the southern third of Illinois during the month was 19° at Olney. The protracted mild period is reflected by the fact that at Springfield, for example, only 2 days during February were below normal in respect to temperature. The excess in temperature is also depicted by the station mean temperatures, which ranged from 29.2° at Marengo to 44.8° at Cairo. Normally the State average is 29.9° for February. There were, of course, no extended periods of subnormal temperatures, but major drops from prevailing high levels occurred over most sections around the 6th, 14th, 22d, and 29th. Conversely, highest temperature levels were centered around the 10th, 19th, and 27th.

Precipitation averaged 0.25 inch below normal. Falls of an inch or more within a 24-hour period were confined largely to the extreme south. In that area, heaviest daily totals occurred during the first few days of the month. The total of 1.62 inches at Anna on the 1st was the greatest 24-hour fall. Over the remainder of the State, greatest daily amounts at a majority of reporting points occurred during heavy snows on either the 14th or 19th. Totals reported for the month ranged from 0.92 inch below normal in the northern division to 0.09 inch below normal in the central division and to 0.32 inch above normal in the southern division. The least monthly total was 0.14 inch at Wheaton College, while the greatest was 4.84 inches at Glendale Experimental Farm. Snowfall totals for February ranged from none at DuQuoin and McLeansboro to 10.0 inches at Chenoa.

Frequent periods of thawing prevented most field work, particularly in the southern part of the State. However, winter wheat prospects were considered to range from good to excellent.- JTC

REFERENCE NOTES

The four digit identification numbers in the index number column of the Station Index are assigned on a state basis. There will be no duplication of numbers within a state.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Observation times given in the Station Index are in local standard time.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Monthly and seasonal snowfall and heating degree days for the preceding 12 months will be carried in the June issue of this bulletin.

Stations appearing in the Index, but for which data are not listed in the tables, are either missing or received too late to be included in this issue.

Unless otherwise indicated, dimensional units used in this bulletin are: temperature in °F., precipitation and evaporation in inches, and wind movement in miles. Degree days are based on a daily average of 65°F. Evaporation is measured in the standard Weather Bureau type pan of 4 foot diameter unless otherwise shown by footnote following Table 6.

Sleet and hail were included in snowfall averages in Table 1, beginning with July 1948.

Amounts in Table 3 are from non-recording gages, unless otherwise indicated.

Data in Tables 3, 5, 6, and snowfall data in Table 7 are for the 24 hours ending at time of observation. See the Station Index for observation time.

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA stations. For these stations snow on ground values are at 1830 CST.

-	No record in Tables 3, 6, 7, and the Station Index. No record in Tables 2 and 5 is indicated by no entry.
+	And also on a later date or dates.
*	Amount included in following measurement, time distribution unknown.
//	Gage is equipped with a windshield.
B	Adjusted to a full month.
E	Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of new snowfall.
M	One or more days of record missing; see Table 5 for detailed daily record. Degree Day data, if carried for this station, have been adjusted to represent the value for the full month.
R	Daily values and monthly total from recording gage. All other data in Table 3 are from non-recording gages.
T	Trace, an amount too small to measure.
V	Includes total for previous month.
SS	This entry in time of observation column in Station Index means observation made near sunset.

Subscription Price: 15 cents per copy; monthly and annual, $1.50 per year. (Yearly subscription includes the Annual Summary.) Checks and money orders should be made payable to the Treasurer of the United States. Remittances and correspondence regarding subscriptions should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D. C.

ILLINOIS

MARCH 1952
Volume LVII No. 3

KANSAS CITY: 1952

ILLINOIS - MARCH 1952

Paul F. Sutton, Section Director - Springfield

WEATHER SUMMARY

The temperature regime for March 1952 is marked by the occurrence of extreme temperatures both at the beginning and end of the month. The first 5 days were quite cold, and the lowest readings at most stations were reported on the 5th. Conversely, the last few days of the month were marked by temperature levels much above seasonable normals, and maxima for the month were observed at most points during the period from the 29th through the 31st. The 20th was also quite mild over the southern third of the State. Mild periods, however, were few and of short duration. Most sections reported above-normal temperatures during the periods March 10-14, 18-23, and 29-31. The remainder of the month was below normal for the most part. The State-wide average temperature of 38.9° was 2.1° below normal. Monthly mean temperatures ranged from a high of 48.0° at Cairo to a low of 30.2° at Stockton. The lowest daily temperature was 10° below zero at Freeport on the 5th, and the highest was 79°, which occurred at Sparta on the 20th and at Alton on the 29th, 30th, and 31st.

Precipitation during the month averaged 1.18 inches above normal for the State. However, the State-wide average of 4.38 inches resulted in large part from extremely heavy totals over the southern third of Illinois. In that area the total for the month averaged 6.34 inches, or 2.26 inches above normal; much of this total accrued during heavy rains around the 10th of the month. At that time, several localities in extreme southern Illinois reported 24-hour falls in excess of 3 inches; Cairo recorded a 24-hour total of 3.70 inches. Falls over the remainder of the State were also above normal, but the excess was considerably less. Central counties averaged 3.71 inches, which was only 0.54 inch above normal; communities in the extreme north reported an average fall of 3.86 inches, or 1.28 inches in excess of normal. The least monthly total, 1.83 inches, fell at White Hall, while the greatest, 8.58 inches, occurred at New Burnside. Snowfall totals averaged 10.6 inches in extreme northern Illinois and declined to 3.6 inches in central sections and to less than an inch over extreme southern localities. The greatest total snowfall was measured at Marengo, where 19.5 inches were deposited during the month. Neither Elizabethtown nor Golconda Dam recorded any snow.

Two tornadoes occurred during the month, both on the 18th. The first struck at Kane, Illinois, and caused damage to residences and outbuildings estimated at $25,000. The second struck at Evansville, where destruction to buildings and plants reached a total of $50,000. There were no fatalities in either instance, and crop damage was negligible due to the season of the year.--JTC

REFERENCE NOTES

The four digit identification numbers in the index number column of the Station Index are assigned on a state basis. There will be no duplication of numbers within a state.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Observation times given in the Station Index are in local standard time.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Monthly and seasonal snowfall and heating degree days for the preceding 12 months will be carried in the June issue of this bulletin.

Stations appearing in the Index, but for which data are not listed in the tables, are either missing or received too late to be included in this issue.

Unless otherwise indicated, dimensional units used in this bulletin are: temperature in °F., precipitation and evaporation in inches, and wind movement in miles. Degree days are based on a daily average of 65°F. Evaporation is measured in the standard Weather Bureau type pan of 4 foot diameter unless otherwise shown by footnote following Table 6.

Sleet and hail were included in snowfall averages in Table 1, beginning with July 1948.

Amounts in Table 3 are from non-recording gages, unless otherwise indicated.

Data in Tables 3, 5, 6, and snowfall data in Table 7 are for the 24 hours ending at time of observation. See the Station Index for observation time.

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA stations. For these stations snow on ground values are at 1830 CST.

-	No record in Tables 3, 6, 7, and the Station Index. No record in Tables 2 and 5 is indicated by no entry.
+	And also on a later date or dates.
*	Amount included in following measurement, time distribution unknown.
//	Gage is equipped with a windshield.
B	Adjusted to a full month.
E	Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of new snowfall.
M	One or more days of record missing; see Table 5 for detailed daily record. Degree Day data, if carried for this station, have been adjusted to represent the value for the full month.
R	Daily values and monthly total from recording gage. All other data in Table 3 are from non-recording gages.
T	Trace, an amount too small to measure.
V	Includes total for previous month.
SS	This entry in time of observation column in Station Index means observation made near sunset.

Subscription Price: 15 cents per copy; monthly and annual, $1.50 per year. (Yearly subscription includes the Annual Summary.) Checks and money orders should be made payable to the Treasurer of the United States. Remittances and correspondence regarding subscriptions should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D. C.

CLIMATOLOGICAL DATA

ILLINOIS

APRIL 1952
Volume LVII No. 4

KANSAS CITY: 1952

ILLINOIS - APRIL 1952

Paul F. Sutton, Section Director - Springfield

WEATHER SUMMARY

The average temperature for April 1952 was 53.3°, which is only 0.8° above normal. Localities in the northern third of the State reported averages which were 2.3° above normal, but this was counterbalanced by a departure of 0.4° above normal in central counties and 0.7° below normal in the extreme southern third. The highest mean temperature for the month was 58.7° at Cairo, while the lowest mean was 49.1° recorded at Waukegan. The disparity of only 9.6° in mean temperature extremes is noteworthy when contrasted to the 17.8° difference of the preceding month. The highest reading for the month was 93°, which occurred at Lacon on the 29th. Freeport reported the lowest, which was 19° on the 7th. While there were minor day-to-day variations in temperature throughout the month, the first half of April was largely below normal while the latter half was above. With few exceptions, most reporting points recorded the lowest temperatures of the month during the period from the 6th through the 11th, while highest temperatures generally occurred during the last 5 days of April.

Precipitation during April averaged 3.72 inches, which is only 0.17 inch above normal. However, counties in the northern third of the State averaged 0.18 inch below normal, while central localities averaged 0.50 inch above, and reporting points in the extreme south averaged 0.03 inch below normal. During the first week, precipitation occurred rather generally on the 3d and 4th, with heaviest amounts reported from central and southern sections. Every day of the second week of April was marked by the occurrence of precipitation. Greatest falls occurred on the 12th, when the entire State averaged more than an inch of rain. The third week was comparatively dry, although light showers occurred toward its end. For the remainder of the month, there were frequent shower periods of which only the 22d is noteworthy because of the heavy falls in central Illinois. The greatest monthly total precipitation occurred at Bloomington, where a total of 6.10 inches was recorded. The least total was 1.12 inches recorded at Fulton Dam. The greatest total snowfall for the month was 2.0 inches, which fell at Chicago Heights. No snowfall was reported from numerous points, chiefly in the southern third of the State.

No major storms were reported during the month.--JTC

REFERENCE NOTES

The four digit identification numbers in the index number column of the Station Index are assigned on a state basis. There will be no duplication of numbers within a state.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Observation times given in the Station Index are in local standard time.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Monthly and seasonal snowfall and heating degree days for the preceding 12 months will be carried in the June issue of this bulletin.

Stations appearing in the Index, but for which data are not listed in the tables, are either missing or received too late to be included in this issue.

Unless otherwise indicated, dimensional units used in this bulletin are: temperature in °F., precipitation and evaporation in inches, and wind movement in miles. Degree days are based on a daily average of 65°F. Evaporation is measured in the standard Weather Bureau type pan of 4 foot diameter unless otherwise shown by footnote following Table 6.

Sleet and hail were included in snowfall averages in Table 1, beginning with July 1948.

Amounts in Table 3 are from non-recording gages, unless otherwise indicated.

Data in Tables 3, 5, 6, and snowfall data in Table 7 are for the 24 hours ending at time of observation. See the Station Index for observation time.

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA stations. For these stations snow on ground values are at 1830 CST.

-	No record in Tables 3, 6, 7, and the Station Index. No record in Tables 2 and 5 is indicated by no entry.
+	And also on a later date or dates.
*	Amount included in following measurement, time distribution unknown.
//	Gage is equipped with a windshield.
B	Adjusted to a full month.
E	Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of new snowfall.
M	One or more days of record missing; see Table 5 for detailed daily record. Degree Day data, if carried for this station, have been adjusted to represent the value for the full month.
R	Daily values and monthly total from recording gage. All other data in Table 3 are from non-recording gages.
T	Trace, an amount too small to measure.
V	Includes total for previous month.
SS	This entry in time of observation column in Station Index means observation made near sunset.

Subscription Price: 15 cents per copy; monthly and annual, $1.50 per year. (Yearly subscription includes the Annual Summary.) Checks and money orders should be made payable to the Treasurer of the United States. Remittances and correspondence regarding subscriptions should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D. C.

ILLINOIS

MAY 1952
Volume LVII No. 5

KANSAS CITY: 1952

ILLINOIS - MAY 1952

Paul F. Sutton, Section Director - Springfield

WEATHER SUMMARY

The average temperature for May 1952 was 62.6°, which is 0.1° below normal. Averages in the northern and central thirds of the State were 0.2° and 0.3° below normal, respectively; however, temperatures in the southern third of the State averaged 66.1°, which is 0.3° above normal. The highest temperature recorded in the State during May was 97° at Quincy on the 5th. From May 1 through May 6, temperatures were much above normal, and most stations experienced their highest readings of the month during that time. Immediately following this period of warm weather, temperatures fell to considerably below normal. Lowest readings for the month occurred on the 11th at a majority of Illinois reporting stations. On the 11th Aurora reported a minimum of 31°, the lowest recorded for the month. The highest mean temperature was 69.4°, reported from Cairo, while the least mean was 55.9° at Waukegan. As previously stated, the first half of the month was marked by an abrupt reversal in temperature trend, since the first week was much above normal and the second considerably below. The second half of May, however, was not characterized by any great deviation from normal.

On a State-wide basis, precipitation during May averaged 3.52 inches, which is only 0.61 inch below normal. However, northern and central counties reported total rainfall for the month which was only about one-third of an inch below normal, while areas in the extreme southern portion of the State received total falls during the month which averaged 1.40 inches below normal. This deficiency during May marked the beginning of droughty conditions over the southern third of Illinois and, in spite of the excellent condition of major crops, constituted a threat to crop futures in that area. Total precipitation for May ranged from 7.61 inches at Urbana to 1.11 inches at East Saint Louis. A few flakes of snow fell at several observing points, but there were no measurable amounts. From the 1st through the 4th, there was little or no precipitation, but the remainder of the month was marked by frequent periods of light showers with greatest totals in central and northern portions.

A tornado occurred at Belleville on May 24. Damage was confined to Scott Air Force Base, where 14 aircraft were wrecked and a small building demolished. High winds and hail, accompanying a thunderstorm, caused an estimated $75,000 damage around Gladstone on the 14th.--JTC

REFERENCE NOTES

The four digit identification numbers in the index number column of the Station Index are assigned on a state basis. There will be no duplication of numbers within a state.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Observation times given in the Station Index are in local standard time.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Monthly and seasonal snowfall and heating degree days for the preceding 12 months will be carried in the June issue of this bulletin.

Stations appearing in the Index, but for which data are not listed in the tables, are either missing or received too late to be included in this issue.

Unless otherwise indicated, dimensional units used in this bulletin are: temperature in °F., precipitation and evaporation in inches, and wind movement in miles. Degree days are based on a daily average of 65°F. Evaporation is measured in the standard Weather Bureau type pan of 4 foot diameter unless otherwise shown by footnote following Table 6.

Sleet and hail were included in snowfall averages in Table 1, beginning with July 1948.

Amounts in Table 3 are from non-recording gages, unless otherwise indicated.

Data in Tables 3, 5, 6, and snowfall data in Table 7 are for the 24 hours ending at time of observation. See the Station Index for observation time.

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA stations. For these stations snow on ground values are at 1830 CST.

-	No record in Tables 3, 6, 7, and the Station Index. No record in Tables 2 and 5 is indicated by no entry.
+	And also on a later date or dates.
*	Amount included in following measurement, time distribution unknown.
//	Gage is equipped with a windshield.
B	Adjusted to a full month.
E	Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of new snowfall.
M	One or more days of record missing; see Table 5 for detailed daily record. Degree Day data, if carried for this station, have been adjusted to represent the value for the full month.
R	Daily values and monthly total from recording gage. All other data in Table 3 are from non-recording gages.
T	Trace, an amount too small to measure.
V	Includes total for previous month.
SS	This entry in time of observation column in Station Index means observation made near sunset.

Subscription Price: 15 cents per copy; monthly and annual, $1.50 per year. (Yearly subscription includes the Annual Summary.) Checks and money orders should be made payable to the Treasurer of the United States. Remittances and correspondence regarding subscriptions should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D. C.

ILLINOIS

JUNE 1952
Volume LVII No. 6

KANSAS CITY: 1952

ILLINOIS - JUNE 1952

Paul F. Sutton, Section Director - Springfield

WEATHER SUMMARY

Weather in Illinois during June 1952 continued the excellent growing conditions of preceding months with near record high temperatures and above-normal rainfall. The average temperature of 77.8° for the entire State was 5.7° above normal; it is the second highest June State average since records were begun in 1890. The warmest June of record was in 1934, when the average temperature was 79.0°. A reading of 108° recorded at East Saint Louis on June 29, 1952, tied the State-wide high for June, which was also set in 1934. Lowest temperature during the month was 44° at Waukegan on the 1st. The coolest period of the month was the 1st and 2d, with another appreciable drop around the 20th. Quite high temperatures prevailed during other periods, with the warmest period being from the 25th to the close of the month. The maximum temperature departure occurred in the southern third of the State, where the anomaly was plus 6.7°.

Rainfall averaged 4.64 inches over the State, which total is 0.62 inch above normal. The southern third of the State showed a deficit of 1.17 inches, which was more than offset by an excess of 1.43 inches in the northern third and a 0.99 inch excess in the central third. The largest amount of rain during the month fell at Lacon, where 9.52 inches was measured, while the least monthly total of 0.17 inch was recorded at Brookport Dam. Scattered thundershowers occurred at frequent intervals over the northern two-thirds of the State. In the southern third, the only general showers fell on the 9th and 10th and again around the 22d. Northern sections reported general showers on the 9th, 12th to 14th, 17th, 20th, and 21st. Daily amounts in excess of 1 inch were common on the rainy days in northern sections, and a few local areas received 24-hour amounts in excess of 3 inches. However, no extensive flooding occurred.

Storm damage during the month resulted mainly from high winds and hail accompanying locally severe thunderstorms. Total property damage from these local storms during June 1952 was reported as $334,750, while damage to crops was estimated at $121,000. The majority of property damage occurred in northern sections on the evening of the 8th; the greater portion of the crop damage was to fruit on the afternoon of the 9th in the area around Anna. On the evening of June 8, seven persons in northern Illinois lost their lives from direct lightning strikes or contingent accidents.

Crops continued to develop well, and the outlook at the close of the month was for near-record production.--PFS
